1   `acis_process_events`

This spec, which is incomplete, describes some of processing steps for continuous-clocking mode data.

1.1   Description

1.2   Input

1.3   Output

1.4   Parameters

1.5   Processing

1.5.1   Error checking

The following steps are performed once prior to the processing of the data for each input ACIS event.

1. `obsfile`:

   (a) Validation:

   i. If

   $$obsfile = NONE, \tag{1}$$

   then `obsfile` is changed to "none".

   ii. Existence:
   If

   $$obsfile \neq none \tag{2}$$

   and the `obsfile` does not exist, then `obsfile` is changed to "none" and `acis_process_events` produces a warning message.

iii. Permission:
If

$$\texttt{obsfile} \quad \neq \quad \text{none} \tag{3}$$

and the file permissions do not allow the `obsfile` to be read, then `obsfile` is changed to "none" and `acis_process_events` produces a warning message.

iv. OBS_MODE:
If

$$\texttt{obsfile} \quad \neq \quad \text{none} \tag{4}$$

then

A. If the `obsfile` does not include the keyword OBS_MODE, then $\text{OBS\_MODE}_{\text{in}}$ is set to "none".

B. If the `obsfile` includes the keyword OBS_MODE then $\text{OBS\_MODE}_{\text{in}}$ is set to OBS_MODE.

C. If

$$\text{OBS\_MODE}_{\text{in}} \quad = \quad \text{POINTING}, \tag{5}$$

then $\text{OBS\_MODE}_{\text{in}}$ is set to "pointing".

D. If

$$\text{OBS\_MODE}_{\text{in}} \quad = \quad \text{SECONDARY}, \tag{6}$$

then $\text{OBS\_MODE}_{\text{in}}$ is set to "secondary".

$$\texttt{pix\_adj} \quad = \quad \text{edser} \tag{120}$$

   and

$$\texttt{DATAMODE} \quad = \quad \text{CC33\_GRADED or} \tag{121}$$
$$\texttt{DATAMODE} \quad = \quad \text{GRADED} \tag{122}$$

   and the `infile` does not include the column FLTGRADE, then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message.

12. `subpixfile`:

   (a) If

$$\texttt{pix\_adj} \quad = \quad \text{edser,} \tag{123}$$

   then

   i. Existence:
      If the `subpixfile` does not exist, then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message.

   ii. Permission:
       If the `subpixfile` exists and the file permissions do not allow it to be read, then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message.

   iii. Validation:
       A. CONTENT:
          If the `subpixfile` does not have one or more HDUs h_{subpix} with the keyword

$$\texttt{CONTENT} \quad = \quad \text{AXAF\_SUBPIX,} \tag{124}$$

          then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message.

       B. Keyword:
          If the HDUs h_{subpix} of the `subpixfile` do not include the keyword CCD_ID, then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message.

       C. Columns:
          If the HDUs h_{subpix} of the `subpixfile` do not include binary tables with the columns FLTGRADE, NPOINTS, ENERGY, CHIPX_OFFSET, and CHIPY_OFFSET, then `pix_adj` is changed to "none" and `acis_process_events` produces a warning message. Hereafter these columns are referred to as $\text{FLTGRADE}_{\text{subpix}}$, $\text{NPOINTS}_{\text{subpix}}$, $\text{ENERGY}_{\text{subpix}}$, $\text{CHIPX\_OFFSET}_{\text{subpix}}$, and $\text{CHIPY\_OFFSET}_{\text{subpix}}$, respectively.

1.5.2 Initializations

1. Focal-point CCD:
   If

   $$\text{OBS\_MODE}_{\text{in}} = \text{pointing} \tag{125}$$

   and

   $$\text{DATAMODE}_{\text{in}} = \text{CC33\_FAINT or} \tag{126}$$
   $$\text{DATAMODE}_{\text{in}} = \text{CC33\_GRADED,} \tag{127}$$

   then the values of $\text{RA\_PNT}_{\text{in}}$ and $\text{DEC\_PNT}_{\text{in}}$ are used to determine the CCD_ID associated with the focal point. Hereafter this value is referred to as $\text{CCD\_ID}_{\text{focus}}$.[*]

2. `acaofffile`:
   If

   $$\text{OBS\_MODE}_{\text{in}} = \text{pointing and} \tag{128}$$
   $$\text{acaofffile} \neq \text{none and} \tag{129}$$
   $$\text{alignmentfile} \neq \text{none,} \tag{130}$$

   then

   (a) TIME_{min} and TIME_{max}:
   The `acaofffile` data are processed to determine the earliest and latest times for which there is aspect information:

   $$\text{TIME}_{\text{min}} = \min\left(\text{TIME}_{\text{acaoff}}\right) \text{ and} \tag{131}$$
   $$\text{TIME}_{\text{max}} = \max\left(\text{TIME}_{\text{acaoff}}\right). \tag{132}$$

   (b) $\text{CHIPX\_TARG}_{\text{acaoff,med}}$, $\text{CHIPY\_TARG}_{\text{acaoff,med}}$:
   The values of $\text{CHIPX\_TARG}_{\text{acaoff}}$ and $\text{CHIPY\_TARG}_{\text{acaoff}}$ are computed from the values of RA_TARG and DEC_TARG using the orientation of the telescope (i.e. RA, DEC, and ROLL) and the orientation of the SIM (i.e. DY, DZ, and DTHETA) and the TIMEs in the `acaofffile`. The values of $\text{CHIPX\_TARG}_{\text{acaoff}}$ and $\text{CHIPY\_TARG}_{\text{acaoff}}$ are processed to obtain the median values:

   $$\text{CHIPX\_TARG}_{\text{acaoff,med}} = \text{median}(\text{CHIPX\_TARG}_{\text{acaoff}}) \text{ and} \tag{133}$$
   $$\text{CHIPY\_TARG}_{\text{acaoff,med}} = \text{median}(\text{CHIPY\_TARG}_{\text{acaoff}}). \tag{134}$$

1.5.3 Loop over events

The following steps are performed, in sequence, for each event.

1. `STATUS`:

   (a) Exists:
   If HDU h_{in} of the `infile` includes a 32-bit column named `STATUS`, then

   i. The values of the bits for an event are read from the `infile`.
   ii. The value of $\text{STATUS}[k]$ is set to zero for bits $k = 1$–5, 14, 16–19, and 23 (of 0–31), bits that can be set by `acis_process_events`.

---

[*]The focal point is the location associated with the optical axis in the absence of dither. This location should not be confused with the aim point, which is the location illuminated by an undithered point source provided that the source is not offset from the target location.

iii. If

$$\text{doevtgrade} \quad = \quad \text{yes}, \tag{135}$$

then the value of STATUS[20], the other bit that can be set by acis_process_events, is set to zero.

(b) Does not exist:
   If HDU h_{in} does not include a 32-bit column named STATUS, then

   i. A set of 32 bits are allocated for the event.
   ii. The values of the 32 bits are initialized to zero.

2. EXPNO:

(a) Read:
   The value of EXPNO for an event is given by EXPNO_{in}.

(b) Validation:
   If

$$\begin{aligned} \text{EXPNO} \quad &< \quad 0 \text{ or} \tag{136} \\ \text{EXPNO} \quad &\geq \quad 10^8, \tag{137} \end{aligned}$$

then acis_process_events produces a warning upon completion with a count of the total number of events for which one or the other of these conditions is true. These values should not occur.

3. CCD_ID:

(a) Read:
   The value of CCD_ID for an event is given by $\text{CCD\_ID}_{\text{in}}$.

(b) Validation:
   If

$$\begin{aligned} \text{CCD\_ID} \quad &< \quad 0 \text{ or} \tag{138} \\ \text{CCD\_ID} \quad &> \quad 9, \tag{139} \end{aligned}$$

then acis_process_events exits with an error message because CCD_ID-dependent computations could fail if the value of CCD_ID is unphysical.

4. CHIPX:

(a) Read:
   i. If the infile includes the column CHIPX, then the value of CHIPX for an event is given by

$$\text{CHIPX} \quad = \quad \text{CHIPX}_{\text{in}}. \tag{140}$$

   ii. If the infile does not include the column CHIPX, then the value of CHIPX for an event is given by

$$\text{CHIPX} \quad = \quad \text{CCDX}_{\text{in}} + 1. \tag{141}$$

(b) Validation:
   i. Unphysical:
      If

$$\begin{aligned} \text{CHIPX} \quad &< \quad 1 \text{ or} \tag{142} \\ \text{CHIPX} \quad &> \quad 1024, \tag{143} \end{aligned}$$

then acis_process_events exits with an error message because CHIPX-dependent computations could fail if the value of CHIPX is unphysical.

14

ii. Unexpected:
If

$$\text{CHIPX} \quad = \quad 1 \text{ or} \tag{144}$$

$$\text{CHIPX} \quad = \quad 1024, \tag{145}$$

then **acis_process_events** produces a warning upon completion with a count of the total number of events for which one or the other of these conditions is true. Although these values are not unphysical, they should not occur.

5. **CHIPX_ADJ**:

(a) Initialize:

$$\text{CHIPX\_ADJ} \quad = \quad \text{CHIPX}. \tag{146}$$

6. **NODE_ID**:

(a) Calculate:
The **NODE_ID** of an event is given by

$$\text{NODE\_ID} \quad = \quad \text{int} \left(\frac{\text{CHIPX} - 1}{256} \right), \tag{147}$$

where "int" means the integer portion of (i.e. truncate or round down) the quantity in parentheses.

7. **CHIPY**:

(a) Read:

i. If the **infile** includes the column **CHIPY**, then the value of **CHIPY** for an event is given by

$$\text{CHIPY} \quad = \quad \text{CHIPY}_{\text{in}}. \tag{148}$$

ii. If the **infile** does not include the column **CHIPY** and

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT or} \tag{149}$$

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT\_BIAS or} \tag{150}$$

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{GRADED or} \tag{151}$$

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{VFAINT}, \tag{152}$$

then the value of **CHIPY** for an event is given by

$$\text{CHIPY} \quad = \quad \text{CCDY}_{\text{in}} + 1. \tag{153}$$

iii. If the **infile** does not include the column **CHIPY** and

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_FAINT or} \tag{154}$$

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_GRADED}, \tag{155}$$

then the value of **CHIPY** for an event is given by

$$\text{CHIPY} \quad = \quad \text{TROW}_{\text{in}} + 1. \tag{156}$$

(b) Validation:

i. Unphysical:

A. Timed-exposure mode:
If

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT or} \tag{157}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT\_BIAS or} \tag{158}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{GRADED or} \tag{159}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{VFAINT} \tag{160}$$

and

$$\text{CHIPY} \quad < \quad 1 \text{ or} \tag{161}$$
$$\text{CHIPY} \quad > \quad 1024, \tag{162}$$

then `acis_process_events` exits with an error message because CHIPY-dependent computations could fail if the value of CHIPY is unphysical.

B. Continuous-clocking mode:
If

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_FAINT or} \tag{163}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_GRADED} \tag{164}$$

and

$$\text{CHIPY} \quad < \quad 1 \text{ or} \tag{165}$$
$$\text{CHIPY} \quad > \quad 512, \tag{166}$$

then `acis_process_events` exits with an error message because the CHIPY value is out of range and CHIPY-dependent computations could fail if the value of CHIPY is unphysical (especially if it is less than 1).

ii. Unexpected:
A. FAINT, FAINT_BIAS, or GRADED:
If

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT or} \tag{167}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{FAINT\_BIAS or} \tag{168}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{GRADED} \tag{169}$$

and

$$\text{CHIPY} \quad = \quad 1 \text{ or} \tag{170}$$
$$\text{CHIPY} \quad = \quad 1024, \tag{171}$$

then `acis_process_events` produces a warning upon completion with a count of the total number of events for which one or the other of these conditions is true. Although these values are not unphysical, they should not occur.

B. VFAINT:
If

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{VFAINT} \tag{172}$$

and

$$\text{CHIPY} \quad = \quad 1 \text{ or} \tag{173}$$
$$\text{CHIPY} \quad = \quad 2 \text{ or} \tag{174}$$
$$\text{CHIPY} \quad = \quad 1023 \text{ or} \tag{175}$$
$$\text{CHIPY} \quad = \quad 1024, \tag{176}$$

then `acis_process_events` produces a warning upon completion with a count of the total number of events for which one or another of these conditions is true. Although these values are not unphysical, they should not occur.

C. CC33_FAINT or CC33_GRADED:
   If

$$\text{DATAMODE}_{\text{in}} = \text{CC33\_FAINT or} \tag{177}$$
$$\text{DATAMODE}_{\text{in}} = \text{CC33\_GRADED} \tag{178}$$

and

$$\text{CHIPY} = 1 \text{ or} \tag{179}$$
$$\text{CHIPY} = 512, \tag{180}$$

then `acis_process_events` produces a warning upon completion with a count of the total number of events for which one or the other of these conditions is true. Although these values are not unphysical, they should not occur.

8. `TIME_RO`:

   (a) Continuous-clocking mode:
   If

$$\text{DATAMODE}_{\text{in}} = \text{CC33\_FAINT or} \tag{181}$$
$$\text{DATAMODE}_{\text{in}} = \text{CC33\_GRADED}, \tag{182}$$

then

   i. Read:
      A. Level 0:
      If

$$\text{CONTENT}_{\text{in}} = \text{EVT0}, \tag{183}$$

then the value of `TIME_RO` for an event is given by TIME_{in}.

      B. Level 1, 1.5, or 2:
      If

$$\text{CONTENT}_{\text{in}} = \text{EVT1 or} \tag{184}$$
$$\text{CONTENT}_{\text{in}} = \text{TGEVT1 or} \tag{185}$$
$$\text{CONTENT}_{\text{in}} = \text{EVT2} \tag{186}$$

and

$$\text{TIME\_RO}_{\text{in}} > 0, \tag{187}$$

then

$$\text{TIME\_RO} = \text{TIME\_RO}_{\text{in}}. \tag{188}$$

If

$$\text{CONTENT}_{\text{in}} = \text{EVT1 or} \tag{189}$$
$$\text{CONTENT}_{\text{in}} = \text{TGEVT1 or} \tag{190}$$
$$\text{CONTENT}_{\text{in}} = \text{EVT2} \tag{191}$$

17

and

$$\text{TIME\_RO}_{\text{in}} = 0, \tag{192}$$

then

$$\text{TIME\_RO} = \text{TIME}_{\text{in}}. \tag{193}$$

ii. Validation:
   If

$$\text{TIME\_RO} < 0 \text{ or} \tag{194}$$
$$\text{TIME\_RO} \geq 3 \times 10^9, \tag{195}$$

then `acis_process_events` produces a warning upon completion with a count of the total number of events for which one or the other of these conditions is true. These values should not occur.

9. $\text{CHIPX\_TARG}_{\text{evt}}$, $\text{CHIPY\_TARG}_{\text{evt}}$, and $\text{CHIPY\_TARG}_{\text{eff}}$:
   The coordinate $\text{CHIPY\_TARG}_{\text{eff}}$ is used to compute the coordinates X, Y, and SKY_1D.

   (a) Approximate:
      If

$$\text{DATAMODE}_{\text{in}} = \text{CC33\_FAINT or} \tag{196}$$
$$\text{DATAMODE}_{\text{in}} = \text{CC33\_GRADED} \tag{197}$$

and

$$\text{acaofffile} \neq \text{none}, \tag{198}$$

then:
   i. Initial values:
      The values of $\text{CHIPX\_TARG}_{\text{evt}}$ and $\text{CHIPY\_TARG}_{\text{evt}}$ are computed from the values of RA_TARG and DEC_TARG using the value of $\text{CCD\_ID}_{\text{focus}}$ and using the orientation of the telescope (i.e. RA, DEC, and ROLL) and the orientation of the SIM (i.e. DY, DZ, and DTHETA) at the time given by $\text{TIME\_RO} - (\text{CHIPY\_TARG}_{\text{acaoff,med}} + 1028) \times \text{TIMEDEL}$. The value of $\text{CHIPY\_TARG}_{\text{evt}}$ can be negative.
   ii. ACIS-I0 or -I2:
      If

$$\text{CCD\_ID}_{\text{focus}} = 0 \text{ or} \tag{199}$$
$$\text{CCD\_ID}_{\text{focus}} = 2, \tag{200}$$

then
A. If

$$\text{CCD\_ID} = 0 \text{ or} \tag{201}$$
$$\text{CCD\_ID} = 2, \tag{202}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = \text{CHIPY\_TARG}_{\text{evt}}. \tag{203}$$

18

B. If

$$\text{CCD\_ID} = 1 \text{ or} \tag{204}$$
$$\text{CCD\_ID} = 3, \tag{205}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = 512 - (\text{CHIPY\_TARG}_{\text{evt}} - \text{CHIPY\_TARG}_{\text{acaoff,med}}). \tag{206}$$

C. If

$$\text{CCD\_ID} \geq 4, \tag{207}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = 512 - (\text{CHIPX\_TARG}_{\text{evt}} - \text{CHIPX\_TARG}_{\text{acaoff,med}}). \tag{208}$$

iii. ACIS-I1 or -I3:
If

$$\text{CCD\_ID}_{\text{focus}} = 1 \text{ or} \tag{209}$$
$$\text{CCD\_ID}_{\text{focus}} = 3, \tag{210}$$

then
A. If

$$\text{CCD\_ID} = 0 \text{ or} \tag{211}$$
$$\text{CCD\_ID} = 2, \tag{212}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = 512 - (\text{CHIPY\_TARG}_{\text{evt}} - \text{CHIPY\_TARG}_{\text{acaoff,med}}). \tag{213}$$

B. If

$$\text{CCD\_ID} = 1 \text{ or} \tag{214}$$
$$\text{CCD\_ID} = 3, \tag{215}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = \text{CHIPY\_TARG}_{\text{evt}}. \tag{216}$$

C. If

$$\text{CCD\_ID} \geq 4, \tag{217}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} = 512 + (\text{CHIPX\_TARG}_{\text{evt}} - \text{CHIPX\_TARG}_{\text{acaoff,med}}). \tag{218}$$

iv. ACIS-S:
If

$$\text{CCD\_ID}_{\text{focus}} \geq 4, \tag{219}$$

then

19

A. If

$$\text{CCD\_ID} \quad = \quad 0 \text{ or} \tag{220}$$
$$\text{CCD\_ID} \quad = \quad 2, \tag{221}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} \quad = \quad 512 + (\text{CHIPX\_TARG}_{\text{evt}} - \text{CHIPX\_TARG}_{\text{acaoff,med}}). \tag{222}$$

B. If

$$\text{CCD\_ID} \quad = \quad 1 \text{ or} \tag{223}$$
$$\text{CCD\_ID} \quad = \quad 3, \tag{224}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} \quad = \quad 512 - (\text{CHIPX\_TARG}_{\text{evt}} - \text{CHIPX\_TARG}_{\text{acaoff,med}}). \tag{225}$$

C. If

$$\text{CCD\_ID} \quad \geq \quad 4, \tag{226}$$

then

$$\text{CHIPY\_TARG}_{\text{eff}} \quad = \quad \text{CHIPY\_TARG}_{\text{evt}}. \tag{227}$$

(b) Validation:
If

$$\text{CHIPY\_TARG}_{\text{eff}} \quad < \quad -256 \text{ or} \tag{228}$$
$$\text{CHIPY\_TARG}_{\text{eff}} \quad \geq \quad 1280, \tag{229}$$

then `acis_process_events` produces a warning message.

10. `TG_M`:

(a) Continuous-clocking mode with gratings:
If

$$\text{OBS\_MODE}_{\text{in}} \quad = \quad \text{pointing} \tag{230}$$

and

$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_FAINT or} \tag{231}$$
$$\text{DATAMODE}_{\text{in}} \quad = \quad \text{CC33\_GRADED} \tag{232}$$

and

$$\text{CONTENT}_{\text{in}} \quad = \quad \text{TGEVT1}, \tag{233}$$

then

i. Read:
The value of `TG_M` for an event is given by `TG_M`$_{\text{in}}$.
ii. Validation:

A. If

$$TG\_M \ < \ -99, \tag{234}$$

then

$$TG\_M \ = \ -99 \tag{235}$$

and `acis_process_events` produces a warning upon completion with a count of the total number of events for which this condition is true. These values should not occur.

B. If

$$TG\_M \ > \ 99, \tag{236}$$

then

$$TG\_M \ = \ 99 \tag{237}$$

and `acis_process_events` produces a warning upon completion with a count of the total number of events for which this condition is true. These values should not occur.

11. `CHIPY_TG`:

(a) Continuous-clocking mode with gratings:
    If

$$OBS\_MODE_{in} \ = \ pointing \tag{238}$$

and

$$DATAMODE_{in} \ = \ CC33\_FAINT \ or \tag{239}$$
$$DATAMODE_{in} \ = \ CC33\_GRADED \tag{240}$$

and

$$CONTENT_{in} \ = \ TGEVT1, \tag{241}$$

then

i. Read:
   The value of `CHIPY_TG` for an event is given by `CHIPY_TG`$_{in}$.

ii. Validation:

A. If

$$TG\_M \ > \ -99 \ and \tag{242}$$
$$TG\_M \ < \ 99 \ and \tag{243}$$
$$CHIPY\_TG \ \neq \ NaN \tag{244}$$

and

$$CHIPY\_TG \ \leq \ 0 \ or \tag{245}$$
$$CHIPY\_TG \ \geq \ 1025, \tag{246}$$

then `acis_process_events` exits with an error message because `CHIPY_TG`-dependent computations could fail if the value of `CHIPY_TG` is unphysical.

B. If

$$
\begin{array}{rcll}
\text{TG\_M} & > & -99 \text{ and} & (247) \\
\text{TG\_M} & < & 99 \text{ and} & (248) \\
\text{CHIPY\_TG} & \neq & \text{NaN and} & (249) \\
\text{CHIPY\_TG} & < & 1, & (250)
\end{array}
$$

then

$$
\text{CHIPY\_TG} \;=\; 1. \tag{251}
$$

C. If

$$
\begin{array}{rcll}
\text{TG\_M} & > & -99 \text{ and} & (252) \\
\text{TG\_M} & < & 99 \text{ and} & (253) \\
\text{CHIPY\_TG} & \neq & \text{NaN and} & (254) \\
\text{CHIPY\_TG} & > & 1024, & (255)
\end{array}
$$

then

$$
\text{CHIPY\_TG} \;=\; 1024. \tag{256}
$$

12. `TIME` and `CHIPY_ADJ`:
    For continuous-clocking mode observations, the value of `CHIPY_ADJ` is used to compute the `TIME`, pulse heights, and the coordinates `TDETX`, `TDETY`, `DETX`, and `DETY`.

    (a) Calculate:
        i. Timed exposure mode:
           If

$$
\begin{array}{rcll}
\text{DATAMODE}_{\text{in}} & = & \text{FAINT or} & (257) \\
\text{DATAMODE}_{\text{in}} & = & \text{FAINT\_BIAS or} & (258) \\
\text{DATAMODE}_{\text{in}} & = & \text{GRADED or} & (259) \\
\text{DATAMODE}_{\text{in}} & = & \text{VFAINT}, & (260)
\end{array}
$$

           then

$$
\begin{array}{rcll}
\text{TIME} & = & \text{TIME}_{\text{in}} \text{and} & (261) \\
\text{CHIPY\_ADJ} & = & \text{CHIPY}. & (262)
\end{array}
$$

        ii. Continuous-clocking mode:
            If

$$
\begin{array}{rcll}
\text{DATAMODE}_{\text{in}} & = & \text{CC33\_FAINT or} & (263) \\
\text{DATAMODE}_{\text{in}} & = & \text{CC33\_GRADED} & (264)
\end{array}
$$

            then
            A. Set

$$
\begin{array}{rcll}
\text{CHIPY\_ADJ} & = & 512 \text{ and} & (265) \\
\text{TIME}' & = & \text{TIME\_RO} - (\text{CHIPY\_ADJ} + 1028) \times \text{TIMEDEL}. & (266)
\end{array}
$$

22

B. If

$$\texttt{acaofffile} \neq \text{none}, \tag{267}$$

then

$$\texttt{CHIPY\_ADJ}' = \texttt{CHIPY\_TARG}_{\text{eff}} \text{ and} \tag{268}$$
$$\texttt{TIME}' = \texttt{TIME\_RO} - (\texttt{CHIPY\_ADJ}' + 1028) \times \texttt{TIMEDEL}, \tag{269}$$

and `CHIPY_ADJ` is computed from the values of `RA_TARG` and `DEC_TARG` using the orientation of the telescope (i.e. `RA`, `DEC`, and `ROLL`) and the orientation of the SIM (i.e. `DY`, `DZ`, and `DTHETA`) at the time `TIME'`. At this step, the value of `CHIPY_ADJ` can be negative.

C. If

$$\texttt{CONTENT}_{\text{in}} = \text{TGEVT1 and} \tag{270}$$
$$\texttt{TG\_M} > -99 \text{ and} \tag{271}$$

14. PHAS:

    (a) If HDU 1 of the infile includes the column PHAS, then

28

i. the values of PHAS for an event are read from the `infile`.

ii. If $\text{PHAS}[4] <$ the split threshold, then $\text{STATUS}[k] = 1$ for bit $k = 1$.

iii. If $\text{PHAS}[4] \leq \text{PHAS}[j]$ for one or more $j = 0$–3 or 5–8, then $\text{STATUS}[k] = 1$ for bit $k = 1$.

iv. If $\text{PHAS}[j] > 4095$ for one or more $j = 0$–8, then $\text{STATUS}[k] = 1$ for bit $k = 2$.

15. PHAS_ADJ:

(a) If HDU 1 of the `infile` includes $\text{DATAMODE}_{\text{in}} = \text{CC33\_FAINT}$ and the parameter `apply_cti` $=$ yes and the `ctifile` and `mtlfile` are specified, then the CTI-adjusted pulse heights are computed as follows.

i. The real-valued arrays for the serial CTI adjustment Δ_x, the parallel CTI adjustment Δ_y, and the adjusted pulse heights PHAS_ADJ are initialized such that

$$\Delta_x[j] \quad = \quad 0, \tag{372}$$
$$\Delta_y[j] \quad = \quad 0, \text{ and} \tag{373}$$
$$\text{PHAS\_ADJ}[j] \quad = \quad \text{PHAS}[j] \tag{374}$$

for every element $j = 0$–8, where the starting point for the adjusted pulse heights are the unadjusted pulse heights PHAS. Note that the values of the unadjusted pulse heights PHAS remain unchanged to ensure that it is possible to remove the CTI adjustment or to reapply the adjustment if the algorithm or calibration data are modified.

ii. The CTI iteration counter n is initialized such that

$$n = 1. \tag{375}$$

iii. The temporary variables Δ'_x, Δ'_y, and PHAS_ADJ$'$ are set such that

$$\Delta'_x[j] \quad = \quad \Delta_x[j], \tag{376}$$
$$\Delta'_y[j] \quad = \quad \Delta_y[j], \text{ and} \tag{377}$$
$$\text{PHAS\_ADJ}'[j] \quad = \quad \text{PHAS\_ADJ}[j] \tag{378}$$

for each element j.

(a) If

$$

then the value of CORN_PHA is read from the **infile**.

21. ENERGY:

(a) If the parameter $\mathtt{calculate\_pi} = \text{yes}$ and the parameter **gainfile** is specified and $\mathtt{PHA} > 0$, then

i. The row i in the **gainfile** is identified such that

$$
\mathtt{CCD\_ID} = \mathtt{CCD\_ID}_{\mathrm{gain},i}, \tag{494}
$$

$$
\mathtt{CHIPX\_MIN}_{\mathrm{gain},i} \leq \mathtt{CHIPX} \leq \mathtt{CHIPX\_MAX}_{\mathrm{gain},i}, \qquad \text{and} \tag{495}

$$
\mathtt{CHIPY\_MIN}_{\mathrm{gain},i} \leq \mathrm{nint}(\mathtt{CHIPY\_ADJ}) \leq \mathtt{CHIPY\_MAX}_{\mathrm{gain},i}, \tag{496}

where $\mathtt{CCD\_ID}_{\mathrm{gain}}$, $\mathtt{CHIPX\_MIN}_{\mathrm{gain}}$, $\mathtt{CHIPX\_MAX}_{\mathrm{gain}}$, $\mathtt{CHIPY\_MIN}_{\mathrm{gain}}$, and $\mathtt{CHIPY\_MAX}_{\mathrm{gain}}$ are columns in the **gainfile**.

ii. A uniform random deviate Δp is computed over the interval from $[-0.5, +0.5)$.

iii. The element j of row i of $\mathtt{PHA}_{\mathrm{gain}}$ is identified such that

$$
\mathtt{PHA}_{\mathrm{gain},i}[j] \leq (\mathtt{PHA} + \Delta p) < \mathtt{PHA}_{\mathrm{gain},i}[j + 1], \tag{497}

where $\mathtt{PHA}_{\mathrm{gain}}$ is a vector column in the **gainfile**. If $\mathtt{PHA} + \Delta p < \mathtt{PHA}_{\mathrm{gain},i}[0]$, then $j = 0$. If $\mathtt{PHA}_{\mathrm{gain},i}[\mathtt{NPOINTS} - 2] \leq \mathtt{PHA} + \Delta p$, then $j = \mathtt{NPOINTS} - 2$, where NPOINTS is a column in the **gainfile**.

iv. The ENERGY of an event is computed from the PHA of the event:

$$\text{ENERGY}_{\text{gain},i}[j], \tag{498}$$

where $\text{ENERGY}_{\text{gain}}$ is a vector column in the gainfile.

v. If ENERGY < 0, then ENERGY = 0.

(b) If the parameter calculate_pi = yes and the parameter gainfile is specified and PHA ≤ 0, then ENERGY = 0.

(c) If the parameter calculate_pi = no or if the parameter gainfile is not specified, then

i. If the infile includes the ENERGY of an event, then the ENERGY of the event is equal to the ENERGY in the infile.

ii. If the infile does not include the ENERGY of an event, then ENERGY = 0.

22. PI:

then

i.
$$\text{PI} = \text{int}\left(\frac{\text{ENERGY}}{\text{pi\_bin\_width}}\right) + 1, \tag{500}$$

where "int" indicates the integer portion of what is in parentheses (i.e. the value is truncated or rounded down).

ii. If
$$\text{PI} < 1, \tag{501}$$

then PI = 1.

iii. If
$$\text{PI} > \text{pi\_num\_bins}, \tag{502}$$

then PI = pi_num_bins.

(b) If

$$\text{calculate\_pi} = \text{no} \tag{503}$$

and the infile includes the value of PI for an event, then the value of PI is read from the infile.

23. pix_adj:

Note that it is possible for the centroid algorithm to yield adjustments to CHIPX_ADJ and/or CHIPY_ADJ that are greater than half a pixel. However, the adjustment cannot equal or exceed one pixel.

where $E[k]$ and $E[k+1]$, $\Delta X[k]$ and $\Delta X[k+1]$, and $\Delta Y[k]$ and $\Delta Y[k+1]$ are the k and $(k+1)^{th}$ elements of the vector columns $\text{ENERGY}_{\text{subpix}}$, $\text{CHIPX\_OFFSET}_{\text{subpix}}$, and $\text{CHIPY\_OFFSET}_{\text{subpix}}$, respectively. These columns are in the HDU of the $\texttt{subpixfile}$ where the value of the keyword $\texttt{CCD\_ID}$ is equal to the value of the $\texttt{CCD\_ID}$ of the event. The appropriate row of these columns is the one where $\text{FLTGRADE}_{\text{subpix}} = \text{FLTGRADE}$. The values of k are the ones where
